Week2

October 12, 2020

1 Basic Plotting with matplotlib

You can show matplotlib figures directly in the notebook by using the `%matplotlib notebook` and `%matplotlib inline` magic commands.

`%matplotlib notebook` provides an interactive environment.

```
In [1]: %matplotlib notebook

In [2]: import matplotlib as mpl
        mpl.get_backend()

Out[2]: 'nbAgg'

In [3]: import matplotlib.pyplot as plt
        plt.plot?

In [4]: # because the default is the line style '-',
        # nothing will be shown if we only pass in one point (3,2)
        plt.plot(3, 2)

<IPython.core.display.Javascript object>

<IPython.core.display.HTML object>

Out[4]: [<matplotlib.lines.Line2D at 0x7f54a477c160>]

In [5]: # we can pass in '.' to plt.plot to indicate that we want
        # the point (3,2) to be indicated with a marker '.'
        plt.plot(3, 2, '.')

Out[5]: [<matplotlib.lines.Line2D at 0x7f54c5a29208>]
```

Let's see how to make a plot without using the scripting layer.

```
In [6]: # First let's set the backend without using mpl.use() from the scripting la
        from matplotlib.backends.backend_agg import FigureCanvasAgg
        from matplotlib.figure import Figure

        # create a new figure
        fig = Figure()

        # associate fig with the backend
        canvas = FigureCanvasAgg(fig)

        # add a subplot to the fig
        ax = fig.add_subplot(111)

        # plot the point (3,2)
        ax.plot(3, 2, '.')

        # save the figure to test.png
        # you can see this figure in your Jupyter workspace afterwards by going to
        # https://hub.coursera-notebooks.org/
        canvas.print_png('test.png')
```

We can use html cell magic to display the image.

```
In [7]: %%html
        <img src='test.png' />
```

```
<IPython.core.display.HTML object>
```

```
In [8]: # create a new figure
        plt.figure()

        # plot the point (3,2) using the circle marker
        plt.plot(3, 2, 'o')

        # get the current axes
        ax = plt.gca()

        # Set axis properties [xmin, xmax, ymin, ymax]
        ax.axis([0,6,0,10])
```

```
<IPython.core.display.Javascript object>
```

```
<IPython.core.display.HTML object>
```

```
Out[8]: [0, 6, 0, 10]
```

```
In [9]: # create a new figure
        plt.figure()

        # plot the point (1.5, 1.5) using the circle marker
        plt.plot(1.5, 1.5, 'o')
        # plot the point (2, 2) using the circle marker
        plt.plot(2, 2, 'o')
        # plot the point (2.5, 2.5) using the circle marker
        plt.plot(2.5, 2.5, 'o')
```

```
<IPython.core.display.Javascript object>

<IPython.core.display.HTML object>

Out[9]: [<matplotlib.lines.Line2D at 0x7f549b1b2898>]
```

```
In [10]: # get current axes
         ax = plt.gca()
         # get all the child objects the axes contains
         ax.get_children()
```

```
